

## 6.4 - Comparing the Strength of Acids and Bases

### 6.4 Comparing the Strength of Acids and Bases

*pages 582-590 in Health*

**\*\*Reminder:** A base is a proton ( $H^+$ ) acceptor and an acid is a proton donor.

A strong base readily accepts a proton.

Comparing the strength of acids and bases allows us to make predictions about chemical reactions. (Referring to Table 14)

ex: When sodium bicarbonate and hydrofluoric acid are combined in an aqueous solution, what reaction is likely to occur?

If we look at our table we can see that HF is a stronger acid than  $HCO_3^-$  therefore HF will act as the acid in the reaction and give up the proton

In addition, the  $K_a$  and  $K_b$  values can help us determine hydronium and hydroxide ion concentrations within a solution of weak acid or base.

## 6.4 - Comparing the Strength of Acids and Bases

<b>K<sub>a</sub> and K<sub>b</sub> Values</b>					
<b>Name of Acid</b>	<b>Acid</b>	<b>K<sub>a</sub></b>	<b>Name of Base</b>	<b>Base</b>	<b>K<sub>b</sub></b>
Sulfuric acid	H <sub>2</sub> SO <sub>4</sub>	large	hydrogen sulfate ion	HSO <sub>4</sub> <sup>-</sup>	very small
Hydrochloric acid	HCl	large	chloride ion	Cl <sup>-</sup>	very small
Nitric acid	HNO <sub>3</sub>	large	nitrate ion	NO <sub>3</sub> <sup>-</sup>	very small
Hydronium ion	H <sub>3</sub> O <sup>+</sup>	55.5	water	H <sub>2</sub> O	1.8 × 10 <sup>-16</sup>
Hydrogen sulfate ion	HSO <sub>4</sub> <sup>-</sup>	1.2 × 10 <sup>-2</sup>	sulfate ion	SO <sub>4</sub> <sup>2-</sup>	8.3 × 10 <sup>-13</sup>
Phosphoric acid	H <sub>3</sub> PO <sub>4</sub>	7.5 × 10 <sup>-3</sup>	dihydrogen phosphate ion	H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	1.3 × 10 <sup>-12</sup>
Hexaaquairon(III) ion	Fe(H <sub>2</sub> O) <sub>6</sub> <sup>3+</sup>	6.3 × 10 <sup>-3</sup>	pentaaquahydroxoiron(III) ion	Fe(H <sub>2</sub> O) <sub>5</sub> OH <sup>2+</sup>	1.6 × 10 <sup>-12</sup>
Hydrofluoric acid	HF	7.4 × 10 <sup>-4</sup>	fluoride ion	F <sup>-</sup>	1.4 × 10 <sup>-11</sup>
Formic acid	HCO <sub>2</sub> H	1.8 × 10 <sup>-4</sup>	formate ion	HCO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-11</sup>
Benzoic acid	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> H	6.3 × 10 <sup>-5</sup>	benzoate ion	C <sub>6</sub> H <sub>5</sub> CO <sub>2</sub> <sup>-</sup>	1.6 × 10 <sup>-10</sup>
Acetic acid	CH <sub>3</sub> CO <sub>2</sub> H	1.8 × 10 <sup>-5</sup>	acetate ion	CH <sub>3</sub> CO <sub>2</sub> <sup>-</sup>	5.6 × 10 <sup>-10</sup>
Hexaaquaaluminum ion	Al(H <sub>2</sub> O) <sub>6</sub> <sup>3+</sup>	7.9 × 10 <sup>-6</sup>	pentaaquahydroxoaluminum ion	Al(H <sub>2</sub> O) <sub>5</sub> OH <sup>2+</sup>	1.3 × 10 <sup>-9</sup>
Carbonic acid	H <sub>2</sub> CO <sub>3</sub>	4.2 × 10 <sup>-7</sup>	hydrogen carbonate ion	HCO <sub>3</sub> <sup>-</sup>	2.4 × 10 <sup>-8</sup>
Hydrogen sulfide	H <sub>2</sub> S	1 × 10 <sup>-7</sup>	hydrogen sulfide ion	HS <sup>-</sup>	1 × 10 <sup>-7</sup>
Dihydrogen phosphate ion	H <sub>2</sub> PO <sub>4</sub> <sup>-</sup>	6.2 × 10 <sup>-8</sup>	hydrogen phosphate ion	HPO <sub>4</sub> <sup>2-</sup>	1.6 × 10 <sup>-7</sup>
Hypochlorous acid	HOCl	3.5 × 10 <sup>-8</sup>	hypochlorite ion	OCl <sup>-</sup>	2.9 × 10 <sup>-7</sup>
Ammonium ion	NH <sub>4</sub> <sup>+</sup>	5.6 × 10 <sup>-10</sup>	ammonia	NH <sub>3</sub>	1.8 × 10 <sup>-5</sup>
Hydrocyanic acid	HCN	4.0 × 10 <sup>-10</sup>	cyanide ion	CN <sup>-</sup>	2.5 × 10 <sup>-5</sup>
Hexaaquairon(II) ion	Fe(H <sub>2</sub> O) <sub>6</sub> <sup>2+</sup>	3.2 × 10 <sup>-10</sup>	pentaaquahydroxoiron(II) ion	Fe(H <sub>2</sub> O) <sub>5</sub> OH <sup>+</sup>	3.1 × 10 <sup>-5</sup>
Hydrogen carbonate ion	HCO <sub>3</sub> <sup>-</sup>	4.8 × 10 <sup>-11</sup>	carbonate ion	CO <sub>3</sub> <sup>2-</sup>	2.1 × 10 <sup>-4</sup>
Hydrogen phosphate ion	HPO <sub>4</sub> <sup>2-</sup>	3.6 × 10 <sup>-13</sup>	phosphate ion	PO <sub>4</sub> <sup>3-</sup>	2.8 × 10 <sup>-2</sup>
Water	H <sub>2</sub> O	1.8 × 10 <sup>-16</sup>	hydroxide ion	OH <sup>-</sup>	55.5
Hydrogen sulfide ion	HS <sup>-</sup>	1 × 10 <sup>-19</sup>	sulfide ion	S <sup>2-</sup>	1 × 10 <sup>5</sup>

## 6.4 - Comparing the Strength of Acids and Bases

Finding ion concentrations for **weak** acids and bases require the following approach.

Remember that if you look on your chart of strong and weak acids and you see a small  $K_a$  value, you have a weak acid

Steps:

1. Write the balanced ionization or dissociation equation.
2. Find the  $K_a$  value from the relative strengths of acids and chart.  $K_b$  values will be given in the question.
3. Use the equilibrium constant expression to solve for the concentrations.

Note - the reason why we cannot use the same method for strong acids and bases is because weak acids or bases do not completely ionize.

Ex) Calculate the hydrogen ion concentration in a 0.10 M acetic acid solution.

Ex) Calculate the hydroxide ion concentration in a 0.025 M solution of analine,  $C_6H_5NH_2$ , a weak base with  $K_b = 4.3 \times 10^{-10}$ .

## 6.4 - Comparing the Strength of Acids and Bases

### Calculating $[\text{OH}^-]$ in WEAK Acids and $[\text{H}_3\text{O}^+]$ in WEAK Bases

Again, we may be asked to find  $[\text{OH}^-]$  in an **acid** or the  $[\text{H}^+]$  in a **base**.

Remember that we are calculating the ion concentrations for acid/base **solutions**, which means they are mixed with water.

If we mix an acid with water, we are adding  $\text{OH}^-$  to the acid because water does ionize a bit. Therefore, we can use  $K_w$  to calculate  $[\text{OH}^-]$ .

Ex) What is  $[\text{OH}^-]$  for a 0.100 M solution of  $\text{HNO}_2$ ?

Likewise, if we are adding water to a base, we are actually adding  $\text{H}^+$  ions. We also use  $K_w$  to calculate  $[\text{H}_3\text{O}^+]$  in a basic solution.

Ex) What is the  $[\text{H}_3\text{O}^+]$  in a 0.025 M solution of  $\text{NaOH}$  (a strong base)?

Ex) For the last two examples, are the solutions acidic or basic?

## 6.4 - Comparing the Strength of Acids and Bases

### 6.4 – Comparing the Strength of Acids and Bases Assignment

*Hint: check to see whether you are dealing with a strong or weak acid/base before starting the question.*

1. Calculate  $[\text{H}^+]$  in a 2.00 L solution of HCl in which 3.65 g of HCl is dissolved.
2. Calculate  $[\text{H}^+]$  in a solution containing 3.20 g of  $\text{HNO}_3$  in 250 mL of solution.
3. An acetic acid ( $\text{HC}_2\text{H}_3\text{O}_2$ ) solution is 0.25 M. Find  $[\text{H}_3\text{O}^+]$ .
4. A 500.0 mL solution contains 12.0 g of hydrofluoric acid. Calculate  $[\text{H}^+]$ .

## 6.4 - Comparing the Strength of Acids and Bases

5. When 1.22 g of benzoic acid ( $\text{C}_6\text{H}_5\text{COOH}$ ) is dissolved to make 1.00L of solution, the resulting equilibrium  $[\text{H}^+] = 8.0 \times 10^{-4} \text{ M}$ . Determine the  $K_a$  of the acid. (*Hint: think ICEBOX*)

6. Calculate  $[\text{H}^+]$  **and**  $[\text{OH}^-]$  at  $25^\circ \text{C}$  in:

a. a 5.0 M NaOH solution. NaOH is a strong base.

b. a 0.025 M  $\text{Ca}(\text{OH})_2$  solution.  $\text{Ca}(\text{OH})_2$  is a strong base.

c. a 0.10 M hypochlorous acid solution.

d. a 0.010 M Nitrous acid solution.
